

ASTROFX AURORA

bowentechnovation.com/systems/immersive/astrofxaurora/

First introduced in 2002 and now in our 6th Version (V6), the AstroFXAurora touchscreen driven lighting control system features a modern design allowing lighting and show control via graphic user interface.

Not just a lighting controller!! The system can easily be expanded to control Bluray/DVD/CD players, projectors, switchers, audio levels, door openers, house lights, and any other theater devices.

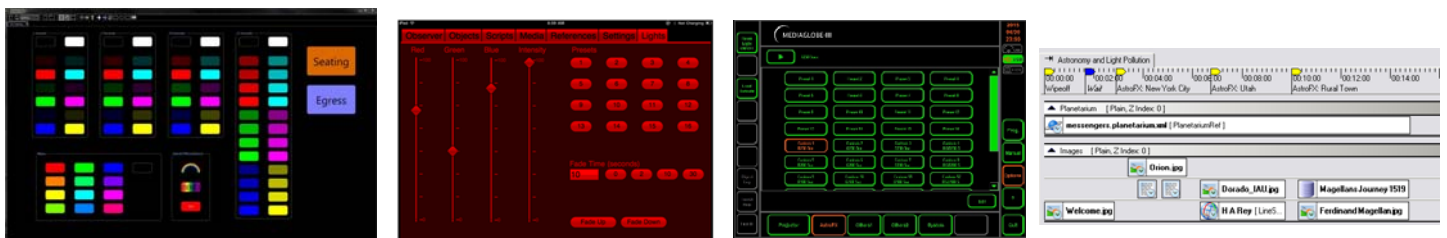

The ultra-modern system uses a minimal amount of hardware...one simple all in one panel PC with touchscreen and one rack mount interface module.

User interface is via the elegant 19" LCD touchscreen, iPad GUI and/or keyboard and mouse.

24/7 video tutorials are available on our website... you will always know how to program a new effect.

This plus unsurpassed post installation support are why we are the preferred provider of audio, lighting, control and other technologies for several major planetarium companies and why we are included in their packages.

The system can receive lighting control commands from various digital astronomy/graphics projection systems including but not limited to Digistar, Mediaglobe, Digitalium, SciDome, and Zeiss PowerDome.

AstroFXAurora control systems include dynamic, native 16-bit per color DMX control of AstroFXAurora R-G-B and R-G-B-W LED light fixtures. This means the operator can simply insert level and fade rate values and hit a save button to create custom fade rates, color mixes and curves (scenes). These custom scenes can then be archived and played back whenever desired.
